

Anorexia Nervosa shows the high blood pressure 'Aurum' marker in purple...

 nidinidi.ca/blog/anorexia-nervosa-shows-the-high-blood-pressure-aurum-marker-in-purple

**Purple is the marker for Aurum in the non invasive diagnostic imaging (Nidi)...
Notice these three example pictures(scroll down to see)- high Aurum(blood pressure in each Nidi result picture)...**

Background: One day, while studying the drug digitalis made from the foxglove plant, I discovered a remarkable factoid...

Digitalis, which raises blood pressure, will trigger anorexia if you give too much...

So basically, too high blood pressure, as an event, can trigger anorexia...

I started thinking that high blood pressure must be a marker for anorexia nervosa...

So I checked in Nidi...

Yes...

Each subject I ran through the Nidi for blood pressure, showed much higher Aurum levels than normals...

Do you know someone suffering from anorexia nervosa?

Run their picture through the Nidi for Aurum(see the videos pages or the free book for how to do the very easy free one step Nidi for Aurum...(Aurum sees B12, taurine, natural blood pressure markers)...

So what does this mean?

It means that possibly Lowering blood pressure could regress anorexia maybe...

Things that lower blood pressure include: Hawthorne berry(most widely used easy to get in health stores), graviola , potassium salts...These are the big three natural things...

Do you think lowering blood pressure could work to reverse anorexia? Very possibly, very possibly...

Sari Grove, July 13, 2019 10:15 pm

More: What event can trigger an extreme rise in blood pressure?

Sunburn, a very bad sunburn...

Causes hypercalcemia and in turn hypertension...

A very bad sunburn could trigger a cataclysmic rise in blood pressure, similar biochemically to an overdose of digitalis- causing the anorexia effect of too high blood pressure...

Explanation: Norepinephrine could be the translation for the marker I am calling "Aurum"...

Norepinephrine raises blood pressure if it is abundant...

Studies of patients with anorexia nervosa show that when they are on the mend, Norepinephrine levels are lowered...

When they get worse, Norepinephrine levels are higher...

Norepinephrine which is a blood pressure marker, also can trigger the perfectionist in traits, the obsessive compulsive, the quick to anger, all the mood behaviours that are tied to hypertension...

arousal/anxiety and cerebral blood flow [71]. Norepinephrine levels are elevated premorbidly in AN [72], but appear to be decreased in plasma and cerebrospinal fluid during active AN and RECAN [72, 73, 74]. Premorbidly high levels of norepinephrine lead to high sympathetic arousal and anxiety [31]. Among individuals with AN, this anxiety is often focused on food- and weight-related issues, though the inherently high trait levels of perfectionism and neuroticism can manifest in other achievement domains such as schoolwork or

sports [75]. Since this anxiety is linked an abundance of norepinephrine, dieting in the early stages of AN counteracts this by depleting the brain of the precursors to norepinephrine that are normally ingested through food [31]. Dieting is then maintained through negative reinforcement, leading to a reduction in body weight and entrenchment of AN symptoms.

Furthermore, aberrant activity in the noradrenergic system has been linked to irregular patterns of activation in the insula, which will be discussed in the next section.

Photos of women showing the very high "Aurum" blood pressure marker as a purple colour...(look for the Aurum Nidi non invasive diagnostic imaging instructions in the free version of my digital book Nidi:nidi by Grove Canada, to do your own check up for this marker!)

Case Study:

I grabbed a photo of both parents and ran it through the Aurum marker Nidi imaging for blood pressure...

The father was clear, but the mother came up very purple- high blood pressure...

Then I checked the daughter, who has anorexia nervosa...Dark purple, over the top high blood pressure markers...Inherited then probably reinforced by nurture...

Interestingly, in this family, there was both a son and a daughter, and the son was fine...

So it seems that anorexia nervosa might travel genetically from the mother to the daughter, skipping the male genes...Of course this is merely speculation until I can look at other case studies...

But for the moment, (as it seemed almost a year ago when I first published about this- at GroveCanada.ca), Anorexia Nervosa seems to be a biochemical disorder involving inherited high blood pressure disorder...

Very possibly also this marker is not showing correctly on cuff blood pressure diagnostics...

Behaviour: People dealing with anorexia nervosa are known to restrict diet tremendously as well as exercise vigorously...

From the perspective of inherited high blood pressure, this all makes sense...Without understanding the problem, they were instinctively trying to lower their own heart pressure...

Not a psychological thing but a need to lower this marker...

Additional thoughts: Getting stung by a bee lowers both Iron and Aurum markers(blood pressure is Aurum in my language)...Bee therapy is called "Apitherapy"...

Body Part	Minus	Plus
Thyroid	Zinc -1	Lead+12
Thymus	Manganese -2	Iron+11
Lungs & Lymph Nodes	Titanium -3	Aluminum +10
Heart	Potassium -4	Aurum +9
Kidneys	Carbon-5	Nitrogen+8
Pancreas	Selenium-6	Sugar+7
Liver	Oxygen-7	Hydrogen+6
Adrenal Gland	Iodine-8	Calcium+5
Spleen	Copper-9	Phosphorus +4
Gallbladder	Magnesium -10	Mercury+3
Colon	Fluorine-11	Bismuth+2
Skene's/ Prostate	Boron-12	Molybdenum +1
